Working together to create a set of tools that will enable clinicians to measure and predict how children with Autism Spectrum Disorder (ASD) respond to treatment.

The ABC-CT is a multicenter research study based at Yale that will focus on preschool and school-aged children with ASD to identify non-invasive biomarkers that could help physicians develop, track, and assess treatments in ASD.

Data collection will take place at: Yale University, Duke University, Boston Children’s Hospital, University of California at Los Angeles, and the University of Washington/Seattle Children’s Research Institute.

Participating families will receive a psychoeducational evaluation describing their child’s development over six months.
