

UCLA Research Opportunity For Kids and Teens With Obsessive-Compulsive Disorder

UCLA Child OCD, Anxiety, and Tic Disorders Program

We Are Studying Whether a Medication Added to Cognitive Behavioral Therapy (CBT) Will Improve Brain Function and Symptoms in Youth with OCD

Does your child:

- ❖ **Have recurring thoughts that make no sense, but make him/her feel bad?**
- ❖ **Wash excessively or fear touching "contaminated" things?**
- ❖ **Check and double-check more than really necessary?**
- ❖ **Have to do things over and over again?**

Eligible Participants Will Receive:

- ❖ **Free Magnetic Resonance Imaging (MRI) Brain Scans**
- ❖ **Free clinical and cognitive testing**

Eligible children must be participating in CBT at the UCLA Childhood OCD, Anxiety, and Tic Disorders Clinic.

- ❖ **Costs of CBT are not covered by this study**

**For more information about the study or our Clinic, please call:
