****3. EXCESSIVE OR INAPPROPRIATE GUILT

...self reproach, for things done or not done, including delusions of guilt. Rate according to proportion between intensity of guilt feelings or severity of punishment child thinks he deserves and the actual misdeeds.

When people say or do things that are good, they usually feel good, and when they say or do something bad they feel bad about it. Do you feel bad about anything you have done? What is it? How often do you think about it? When did you do that? What does it mean if I said I feel guilty about something? How much of the time do you feel like this?

Most of the time?

A lot of the time?

A little of the time?

Not at all?

What kind of things do you feel guilty about?

Do you feel guilty about things you have not done? or are actually not your fault? Do you feel guilty about things your parents or others do? Do you feel you cause bad things to happen? Do you think you should be punished for this?

What kind of punishment do you feel you deserve? Do you want to be punished? How do your parents usually punish you? Do you think it's enough?

For many young children it is preferable to give a concrete example such as: "I am going to tell you about three children and you tell me which one is most like you. The first is a child who does something wrong, then feels bad about it, goes and apologizes to the person, the apologies are accepted, and he just forgets about it from then on. The second child is like the first but after his apologies are accepted, he just cannot forget about what he had done and continues to feel bad about it for one to two weeks. The third is a child who has not done much wrong, but who feels guilty for all kinds of things which are really not his fault like...Which one of these three children is like you?" It is also useful to double check the child's understanding of the questions by asking him to give an example, like the last time he felt guilty "like the child in the story."

****6. ANHEDONIA, LACK OF INTEREST, APATHY, LOW MOTIVATION, OR BOREDOM

This is a summary rating synthesizing anhedonia, boredom and loss of interest. Worst week in past month Boredom is a term all children understand and which frequently refers to loss of ability to enjoy (anhedonia) or to loss of interest or both. Loss of pleasure and loss of interest are not mutually S exclusive and may coexist. 0 No information What are the things you do for fun? Enjoy? (Get examples: nintendo, sports, friends, favorite games, school subjects, outings, family activities, favorite TV programs, computer or video games, music, dancing, playing alone, 1 All activities as pleasurable and reading, going out, etc.). interesting, or more so Do you feel bored a lot of the time? 2 Slight: 1 or 2 activities less Are you bored because you don't enjoy things or because you are not interested in even starting pleasurable or interesting than before or than his/her friends Do you feel bored when you think about doing these things you used to do before you began feeling (sad, etc.)? (Give examples mentioned above.) 3 Mild: Several activities less Does this stop you from doing those things? pleasurable or interesting. Bored Do you (also) feel bored while you are doing things you used to enjoy? or apathetic over 50% of the time during activities Anhedonia refers to partial or complete (pervasive) loss of ability to get pleasure, enjoy, have fun during participation in activities which have been attractive to the child like the ones listed above. 4 Moderate: Most activities much It also refers to basic pleasures like those resulting from eating favorite foods and, in less pleasurable or interesting. adolescents, sexual activities. Bored or apathetic over 75% of the time during activities Do you still do the things you used to do for fun before you began to feel (______)? Do you do less than you used to? How much less? [] [] 5 Severe: Almost all activities much Do you have as much fun doing them as you used to before you began feeling (sad, etc.)? less pleasurable or interesting. If less fun, Do you enjoy them a little less? Much less? Not at all? Bored or apathetic 90% of the time Do you have as much fun as your friends? during activities How many things are less fun now than they used to be? [] [] 6 Extreme: Total inability to How many are as much fun? More fun? experience or interest pleasure ("I What are your favorite foods? don't enjoy anything"). Do you enjoy them as much as you used to? Are there any foods you really enjoy eating? Do they taste as good? C S In adolescents: (if sexually active) **Most Severe** Do you enjoy sex as much as you used to? Past Episode Are you less sexually active than you used to be? Do you find that you start to do things that interest you, but then find you are not enjoying them PAST is not rated at follow up visits as much?

Loss of interest, apathy and low motivation refer to partial or complete (pervasive) loss of ability to anticipate enjoyment and to be interested and/or to have the motivation to pursue activities which have been attractive to the child. The child does not desire to engage in activities and does not initiate them. There is a lack of enthusiasm and anticipatory excitement, not caring about, apathy, lack of motivation in the contemplation of doing things that he/she would normally look forward to.

Do you look forward to doing the things you used to enjoy? (Give examples) Do you try to get into them?

Do you have to push yourself to do your favorite activities? Do they interest you? Do you get excited or enthusiastic about doing them? Why not?

Have you stopped even trying to do things that you used to do because they just don't excite you

anymore? How many things are less interesting now than they were before you started feeling (sad. etc.)?

How many things are as interesting? More interesting?

WHAT ABOUT DURING THE LAST WEEK?

This item does not refer to inability to engage in activities (loss of ability to concentrate on reading, games, TV, or school subjects).

Two comparisons should be made in each assessment: Enjoyment as compared to that of peers and/or enjoyment as compared to that of child when not depressed. The second is not possible in episodes of long duration because normally children's preferences change with age. Severity is determined by the number of activities which are less enjoyable to the child, and by the degree of loss of ability to enjoy.

ID:

Do not confuse with lack of opportunity to do things which may be due to excessive parental restrictions.

****9. PSYCHOMOTOR AGITATION

Includes inability to sit still, pacing, fidgeting, repetitive lip or finger movement, wringing of hands, pulling at clothes, and non-stop talking. To be rated positive, such activities should occur while the subject feels depressed, not associated with the manic syndrome, and not limited to isolated periods when discussing something upsetting. Do not include subjective feelings of tension or restlessness, which are often incorrectly called agitation. To arrive at your rating, take into account your observations during the interview, the child's report and the parent's report about the child's behavior during the episode.

Distinguish from ADHD.

When you feel so (sad), are there times when you can't sit still, or you have to keep moving and can't stop?
Do you walk up and down?
Do you wring your hands? (demonstrate)
Do you pull or rub on your clothes, hair, skin or other things?
Do people tell you not to talk so much?
Did you do this before you began to feel (sad)?
When you do these things, is it that you are feeling (sad) or do you feel high or great?

If someone was taking movies of you while you were eating breakfast and talking to your (mother), and they took these movies before you got (depressed) and again while you were (depressed) would I be able to see a difference?

What would it be?

What would I see?

What would I hear?

Probe: Would it take longer before or while you were (depressed)?

A little longer? Much longer?

If I saw a videotape or heard an audiotape of your child at home while he/she was depressed and another when he/she wasn't depressed, could I tell the difference? If yes, what would I see (hear) different?

Make sure it does not refer to content of speech or acts or to facial expression. Refer only to speed and tempo.

Worst week in past month

PAST is not rated at follow up visits

NOTE: IF CHILD HAS ATTENTION DEFICIT DISORDER, DO NOT RATE THE PSYCHOMOTOR AGITATION ITEM POSITIVELY UNLESS THERE WAS A WORSENING OF AGITATION THAT CORRESPONDED WITH THE ONSET OF THE DEPRESSED MOOD.

****10. PSYCHOMOTOR RETARDATION

Visible, generalized slowing down of physical movement, reactions and speech. It includes long speech latencies. Make certain that slowing down actually occurred and is not merely a subjective feeling. To arrive at your rating take into account your observations during the interview, the child's report and the parent's report about the child's behavior during the episode.

Since you started feeling (sad) have you noticed that you can't move as fast as before?

Have you found it hard to start talking?

Has your speech slowed down?

Do you talk a lot less than before?

Since you started feeling sad, have you felt like you are moving in slow motion?

Have other people noticed it?

If someone was taking movies of you while you were eating breakfast and talking to your (mother), and they took these movies before you got (depressed) and again while you were (depressed) would I be able to see a difference?

What would it be?

What would I see?

What would I hear?

Probe: Would it take longer before or while you were (depressed)? A little longer? Much longer?

If I saw videotape or heard an audiotape of your child at home while he/she was depressed and another when he/she wasn't depressed, could I tell the difference? If yes, what would I see (hear) different?

Make sure it does not refer to content of speech or acts or to facial expression. Refer only to speech and tempo.

****11. INSOMNIA

Sleep disorder, including initial, middle and terminal difficulty in getting to sleep or staying asleep.

Do not rate if he feels no need for sleep.

Take into account the estimated number of hours slept and the subjective sense of lost sleep.

Normally a 6-8 year old child should sleep about 10 hours \pm 1 hour; For 9-12 year olds = 9 hours + 1 hour;

For 12-16 year olds = 8 hours + 1 hour.

Distinguish from other possible causes of insomnia.

Have you had trouble sleeping? What kind of trouble? How long does it take you to fall asleep? Do you wake up in the middle of the night? How many times? Any reason for it (urinating, nightmares)?

At what time do you wake up in the morning?

Is that later or earlier than usual?

Do you wake up before you want, or have to get up? Or before your mother calls you?

Do you feel you would sleep more if you could?

For how long have you been having trouble sleeping?

Are you having this trouble every night? Almost every night?

Sometimes? Only now and then?

Do you feel rested when you wake up?

Do you feel not rested through 3 hours after being up?

Have you slept, at some point during the day and been awake during the night, and just could not sleep?
